

ALERT meeting

AHDC wire swaps - results

Felix Touchte Codjo

IJCLab

May 18, 2026

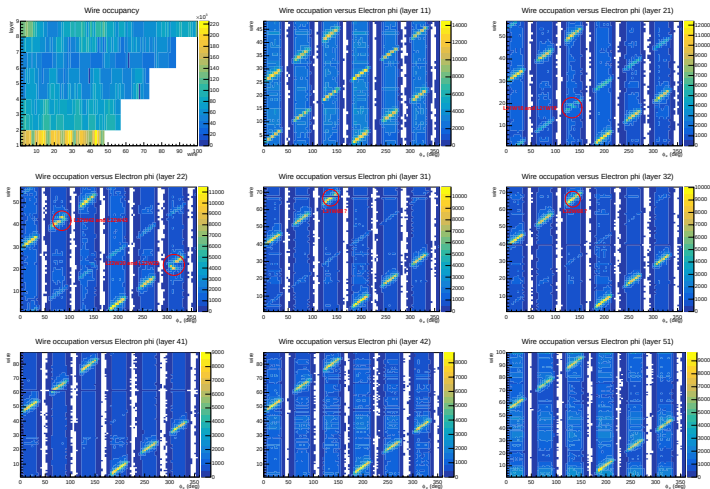

► Summary of wire swaps

1. L21W18 $\longleftrightarrow$ L21W19
2. L22W20 $\longleftrightarrow$ L22W22
3. L22W42 $\longleftrightarrow$ L22W43
4. L31W68 $\longleftrightarrow$ L32W68

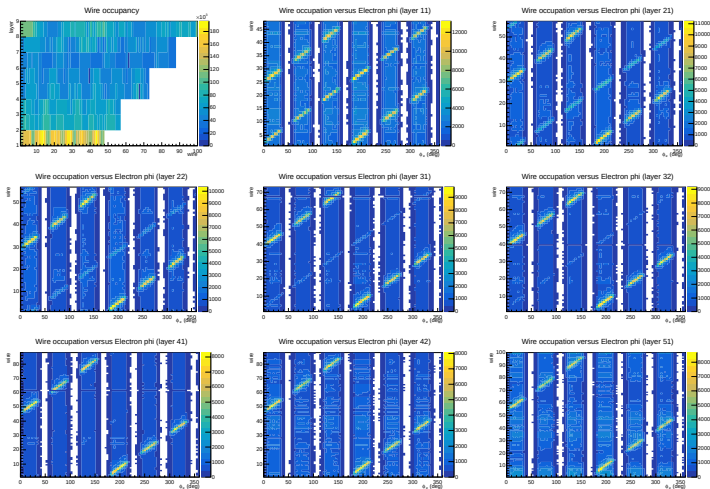

► Comments

- The first 3 swaps appear when we plot the wire occupancy versus the electron ϕ
- The last one appear when we look at the residuals distributions
- Others residual distributions had a bad shape, but they all had a bad t_0 . Their distributions became good when we set them a reasonable value of t_0 .

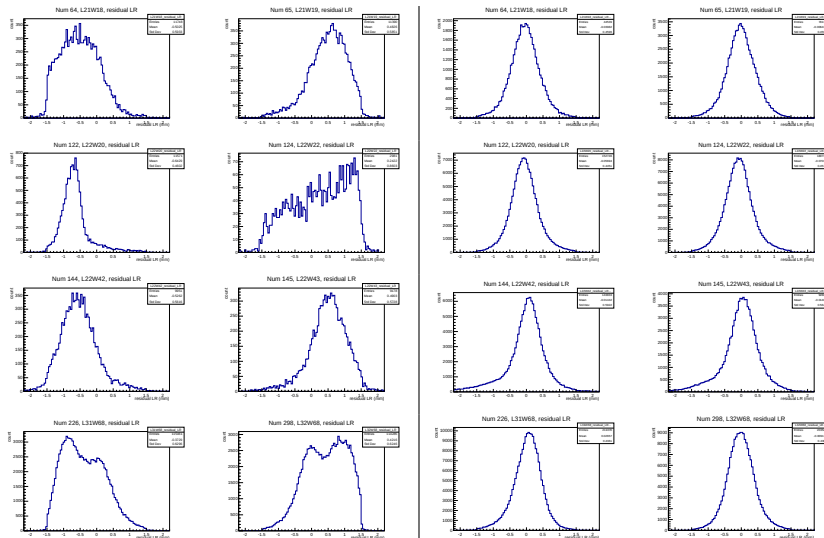

► Illustration : Wire versus phi (old translation table)

► Illustration : Wire versus phi (new translation table)

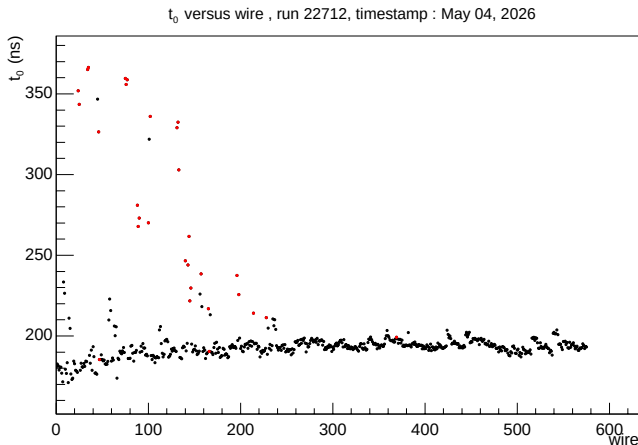

► Illustration : Residual distributions before and after the swaps

Compared to the other swaps, L31W68 and L32W68 had a peak at 0. Same SL, $\neq$ L, same W $\rightarrow$ effect difficult to see in Wire versus Phi

- Illustration : Others residual distributions had a bad shape, but they all had a bad t_0

► Next steps

- Update the translation table with the identified swaps
- Update the t_0 ?
